Technical Specifications

Between 13 April and 11 May 2021, Kantar - on behalf of Kantar Belgium - carried out the wave 95.2 of the Eurobarometer survey, at request of the European Commission, Directorate-General for Communication, "Media monitoring and Eurobarometer" Unit.

Wave 95.2 covers the population of the respective nationalities of the European Union Member States, resident in each of the 27 Member States and aged 15 years and over.

Wave 95.2 has also been conducted in 11 other countries or territories outside the EU: five candidate countries (Albania, Montenegro, North Macedonia, Serbia and Turkey), as well as in Bosnia and Herzegovina, Iceland, Kosovo, Norway, Switzerland and the United Kingdom.

In these countries and territories, the survey covers the national population of citizens and the population of citizens of all the European Union Member States that are residents in these countries and territories and have a sufficient command of the national languages to answer the questionnaire.

The basic sample design, applying in all countries and territories, was a multi-stage, random (probability) one. In each country, a number of sampling points was drawn with probability proportional to population size (for a total coverage of the country) and to population density.

In order to do so, the sampling points were drawn systematically from each of the "administrative regional units", after stratification by individual unit and type of area. They thus represent the whole territory of the countries surveyed according to the EUROSTAT NUTS II (or equivalent) and according to the distribution of the resident population of the respective nationalities in terms of metropolitan, urban and rural areas.

In each of the selected sampling points, a starting address was drawn, at random. Further addresses (every Nth address) were selected by standard "random route" procedures, from the initial address. In each household, the respondent was drawn at random (following the "closest birthday rule"). If no one answered the interviewer in a household, or if the selected respondent was not available (e.g. not present or busy), the interviewer revisited the same household up to three additional times (four contact attempts in total). Interviewers never indicated that the survey was conducted on behalf of the European Commission beforehand; they may have given this information once the survey was completed, upon request.

The recruitment phase was slightly different in the Netherlands. In this country, a sample of addresses within each areal sampling point (1km² grid) were selected from the address or population register. The selection of addresses was done randomly. Households were then contacted by telephone and recruited to take part in the survey.

CAPI : Computer-Assisted Personal interviewing CAWI : Computer-Assisted Web interviewing

Consequences of the coronavirus pandemic on fieldwork

Face-to-face interviewing

Where feasible, interviews were conducted face-to-face in people's homes or on their doorstep and in the appropriate national language. Countries where only face-to-face interviewing took place are: Bulgaria, Germany, Greece, Spain, France, Croatia, Italy, Cyprus, Hungary, Austria, Poland, Romania, Turkey, North Macedonia, Montenegro, Serbia, Albania, Bosnia and Herzegovina, and the territory of Kosovo. In all countries and territories where face-to-face interviewing was feasible CAPI (Computer Assisted Personal Interviewing) was used. For all interviews conducted face-to-face, hygiene and physical distancing measures were respected at all times in line with government regulations, and whenever possible, interviews were conducted outside homes (e.g. on doorsteps) to remain in open air and maintain social distance.

Face-to-face and online interviewing

In Denmark, Malta, the Netherlands, Slovenia, Slovakia and Turkey: face-to-face interviewing was feasible but it was not possible to reach the target number of face-to-face interviews within the fieldwork period due to the impact of Covid-19 restrictions: many potential respondents were reluctant to open their homes to interviewers, even if they respected hygiene rules and physical distancing, such as wearing masks and using hydro-alcoholic gel.

Therefore, to hit the target number of interviews within the fieldwork period, additional interviews were conducted online with Computer-Assisted Web Interviewing (CAWI) technique.

Online interviewing

In Belgium, Czechia, Estonia, Ireland, Latvia, Lithuania, Luxembourg, Portugal, Finland, Sweden, United Kingdom, Iceland, Norway and Switzerland: face-to-face interviews were not possible. Therefore all interviews were conducted online with CAWI technique.

Recruitment for online interviews

In the EU

The online design in each country differed based on what was feasible within the fieldwork period.

Where possible, the online sample was based on a probabilistic sample design. Those recruited to the online survey were recruited through a single mobile frame or dual frame Random Digit Dialling (RDD) design. In this way the entire phone owning population in each country had a non-zero chance of being sampled. The choice of whether to use a single mobile frame or dual frame (mobile and landline) was dependent on the countries' landline infrastructure. Where the landline infrastructure is suitably advanced to support a significant minority of residential households with landline phones, a dual frame design is employed. The mix of mobile and landline sample is designed to maximise the representativeness of the responding sample. The RDD sample for both the mobile and landline sample is drawn from the country's telephone numbering plan. The landline sample frame is stratified by NUTS3 regions based on their prefix and the mobile by operator before a systematic random sample of numbers is generated proportional in size to the total generatable numbers in each stratum. Respondents were recruited using this sample design in Belgium, Czechia, Estonia, Ireland, Latvia, Lithuania, Luxembourg, Malta, Portugal, Slovenia and Slovakia.

In **Finland, Denmark,** and **Sweden** RDD samples were not used. Instead, the telephone sample was drawn from the country telephone directory. In these three countries the telephone directories offer comprehensive coverage of the phone-owning population, storing both landline and mobile phone numbers for

In **the Netherlands**, a proprietary panel called "Nipobase" was used, drawing a random sample from their panel. This panel uses a mix of probability-based sampling to recruit panellists and non-probabilistic approaches to maximise representation where the probability-based approach under-represents, such as in the younger age groups. Nipobase uses a mix of offline and online modes. Offline modes are typically RDD samples and online modes are typically recruitment via targeted websites and social media platforms.

Outside the EU:

each individual.

In **the UK**, recruitment of respondents was carried out either via a face-to-face CAPI mode of data collection based on a clustered multistage random sample of addresses or via a postal invite to an online survey using a completely unclustered random sample of addresses.

In **Norway** and **Iceland**, stratified random samples were drawn from among probability-based samples. Recruitments were done using offline modes of data collection (telephone and postal) based on a probability sample design.

Special Eurobarometer 516

European citizen's knowledge and attitudes towards science and technology

In **Switzerland** samples were randomly drawn from the pseudo-probabilistic sample of Demoscope, in which the frame for selecting households was based on a probability sample. Recruitment was done via the telephone directory – which lists landline numbers only in Switzerland, where landline coverage is very high. However the selection of individuals in the households to join the panel was not random, as demoscope recruited the first person who answered the phone in each household (therefore not implementing any random selection method within the household).

Please note that for some countries where the response rates were not sufficiently large to achieve the target sample size in the fieldwork period, we had to further supplement the samples drawn probabilistically (either face-to-face or phone-to-web) with non-probabilistic panels. This was effectively a 'last resort' option when no other probabilistic design was feasible.

In **Turkey**, the sample was supplemented with a randomly drawn sample from Kantar's LifePoints non-probabilistic sample panel. The LifePoints panel is Kantar's proprietary panel, used exclusively for Kantar clients and the lead source for Kantar's online work, generating close to 30 million completes per year. Members are recruited via online advertising across a wide range of web and social media sites. Adverts are placed with websites with very high footfalls to ensure maximised reach.

In **Lithuania**, from Norstat's panel. Norstat's Lithuania panel has around 20.000 active members recruited mostly in the last 6 months. Around 75% of respondents are recruited in probabilistically (via telephone or face-to-face), while the rest are recruited via online advertising and self-register.

Response rates

For each country a comparison between the responding sample and the universe (i.e. the overall population in the country) was carried out. Weights were used to match the responding sample to the universe on gender by age, region and degree of urbanisation. For European estimates (i.e. EU average), an adjustment was made to the individual country weights, weighting them up or down to reflect their age 15+ population as a proportion of the EU age 15+ population.

The response rates are calculated by dividing the total number of complete interviews with the number of all the addresses visited, apart from ones that are not eligible but including those where eligibility is unknown. The following type of addresses are classified as "not eligible" (hence not interviewed): address not found, address demolished, address empty, ineligible household (for examples non-nationals, households with no one aged 15 or over at home during the fieldwork period, etc.), language difficulty. For the wave 95.2, the response rates, calculated by Kantar, are:

	COLINITRIES	CAPI	CAWI

Margins of error

Readers are reminded that survey results are estimations, the accuracy of which - everything being equal - rests on the sample size and on the observed percentage. With samples of about 1,000 interviews, the real percentages vary within the following confidence limits:
